TITLE: Water soluble paclitaxel prodrugs

## Brief Summary Text (11):

The present invention seeks to overcome these and other drawbacks inherent in the prior art by providing compositions comprising a chemotherapeutic and antiangiogenic drug, such as paclitaxel or docetaxel conjugated to a water soluble polymer such as a polyglutamic acid or a polyaspartic acid, for example, or to a water soluble metal chelator. These compositions are shown herein to be surprisingly effective as anti-tumor agents against exemplary tumor models, and are expected to be at least as effective as pactitaxel or docetaxel against any of the diseases or conditions for which taxanes or taxoids are known to be effective. The compositions of the invention provide water soluble taxoids to overcome the drawbacks associated with the insolubility of the drugs themselves, and also provide the advantages of controlled release so that tumors are shown herein to be eradicated in animal models after a single intravenous administration.

#### Brief Summary Text (21):

The present invention may also be described in certain embodiments as a method of treating cancer in a subject. This method includes obtaining a composition comprising a chemotherapeutic drug such as paclitaxel or docetaxel conjugated to a water soluble polymer or chelator and dispersed in a pharmaceutically acceptable solution and administering the solution to the subject in an amount effective to treat the tumor. Preferred compositions comprise paclitaxel or docetaxel conjugated to a polyglutamic acids or polyaspartic acids and more preferably to poly (1-glutamic acid) or poly 1-aspartic acid). The compositions of the invention are understood to be effective against any type of cancer for which the unconjugated taxoid is shown to be effective and would include, but not be limited to breast cancer, ovarian cancer, malignant melanoma, lung cancer, gastric cancer, colon cancer, head and neck cancer or leukemia.

#### Detailed Description Text (5):

The paclitaxel may be rendered water-soluble in two ways: by conjugating paclitaxel to water-soluble polymers which serve as drug carriers, and by derivatizing the antitumor drug with water soluble chelating agents. The latter approach also provides an opportunity for labeling with radionuclides (e.g., .sup.111 In, .sup.90 Y, .sup.166 Ho, .sup.68 G, .sup.99m Tc) for nuclear imaging and/or for radiotherapy studies. The structures of paclitaxel, polyethylene glycol-paclitaxel (PEG-paclitaxel), polyglutamic acid-paclitaxel conjugate (PG-paclitaxel) and diethylenetriaminepentaacetic acid-paclitaxel (DTPA-paclitaxel) are shown in FIG. 1.

### Detailed Description Text (37):

The present example demonstrates the conjugation of <u>paclitaxel to a water-soluble polymer</u>, poly (1-glutamic acid) (PG). The potential of water-soluble polymers used as drug carriers is well established (Kopecek, 1990; Maeda and Matsumura, 1989). In addition to its ability to solubilize otherwise insoluble drugs, the drug-polymer conjugate also acts as a slow-release depot for controlled drug release.

### Detailed Description Text (41):

To a solution of PG (75 mg, repeating unit FW 170, 0.44 mmol) in dry DMF (1.5 mL) was added 20 mg paclitaxel (0.023 mmol, molar ratio PG/paclitaxel=19), 15 mg dicyclohexylcarbodimide (DCC) (0.073 mmol) and a trace amount of dimethylaminopyridine (DMAP). The reaction was allowed to proceed at room temperature for 4 hrs. Thin layer chromatography (TLC, silica) showed complete conversion of paclitaxel (Rf=0.55) to polymer conjugate (Rf=0, mobile phase, CHCl.sub.3 /MeOH=10:1). The reaction mixture was poured into chloroform. The resulting precipitate was collected and dried in a vacuum to yield 65 mg polymer-drug conjugate. By changing the weight ratio of paclitaxel to PG in the starting materials, polymeric conjugates of various paclitaxel concentrations can be synthesized.

#### CLAIMS:

14. A pharmaceutical composition comprising a conjugate of <u>paclitaxel conjugated to a water soluble polymer</u> comprising a polyglutamic acid polymer, wherein said polyglutamic acid polymer has a molecular weight of about 30,000 to about 60,000 daltons, and said conjugate comprises up to 35% by weight of paclitaxel, wherein said conjugate has a higher water solubility than unconjugated paclitaxel and the ability to accumulate in a tumor.

#### CLAIMS:

### We claim:

- 1. A method of treating cancer by administering to a human paclitaxel and a DNA cross-linking anti-neoplastic agent, wherein said paclitaxel and DNA cross-linking anti-neoplastic agent act synergistically to inhibit cancerous cell growth in said human.
- 2. The method of claim 1, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 3. The method of claim 2, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 4. The method of claim 1, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 5. The method of claim 4, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 6. The method of claim 5, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 7. A method of treating cancer by administering to a human paclitaxel and a

DNA cross-linking anti-neoplastic agent, wherein said paclitaxel exerts an effect on a human cell division cycle during M phase to inhibit cancerous growth, said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth, and said paclitaxel and DNA cross-linking anti-neoplastic agent act synergistically to inhibit cancerous cell growth in said human.

- 8. The method of claim 7, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 9. The method of claim 7, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 10. The method of claim 9, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 11. A method of treating cancer by administering to a human paclitaxel and a DNA cross-linking anti-neoplastic agent,

wherein said paclitaxel and DNA cross-linking anti-neoplastic agent are administered within eight hours of each other and

act synergistically to inhibit cancerous cell growth in said human.

- 12. The method of claim 11, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 13. The method of claim 11, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 14. The method of claim 11, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 15. The method of claim 14, wherein said DNA cross-linking anti-neoplastic agent is administered so as to exert an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 16. The method of claim 15, wherein said DNA cross-linking anti-neoplastic agent is administered so as to exert an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 17. A method of treating cancer by administering to a human paclitaxel and a DNA cross-linking anti-neoplastic agent,

wherein said placlitaxel exerts an effect on a human cell division cycle during M phase to inhibit cancerous growth,

said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth,

said paclitaxel and DNA cross-linking anti-neoplastic agent are administered within eight hours of each other, and

said paclitaxel and DNA cross-linking anti-neoplastic agent act synergistically to inhibit cancerous cell growth in said human.

- 18. The method of claim 17, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 19. The method of claim 17, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 20. The method of claim 19, wherein said wherein said DNA cross-linking antineoplastic agent is administered so as to exert an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 21. A method of treating cancer by administering to a human paclitaxel and DNA cross-linking anti-neoplastic agent,

wherein said paclitaxel and DNA cross-linking anti-neoplastic agent are administered within one hour of each other and

act synergistically to inhibit cancerous cell growth in said human.

- 22. The method of claim 21, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 23. The method of claim 22, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 24. The method of claim 17, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 25. The method of claim 21, wherein said DNA cross-linking anit-neoplastic agent is administered so as to exert an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 26. The method of claim 25, wherein said DNA cross-linking anti-neoplastic agent is administered so as to exert an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 27. A method of treating cancer by administering to a human paclitaxel and a DNA cross-linking anti-neoplastic agent,

wherein said placlitaxel exerts an effect on a human cell division cycle during M phase to inhibit cancerous growth, said DNA cross-linking antineoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth,

said paclitaxel and DNA cross-linking anti-neoplastic agent are administered within one hour of each other, and

said paclitaxel and DNA cross-linking anti-neoplastic agent act synergistically to inhibit cancerous cell growth in said human.

- 28. The method of claim 27, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 29. The method of claim 27, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 30. The method of claim 29, wherein said DNA cross-linking anti-neoplastic agent is administered so as to exert an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 31. A method of treating cancer by administering to a human paclitaxel and a DNA cross-linking anti-neoplastic agent,

wherein said paclitaxel and DNA cross-linking anti-neoplastic agent are administered to said human in such temporal proximity to each other so as to simultaneously achieve levels of said paclitaxel and DNA cross-linking anti-neoplastic agent in said human sufficient to act synergistically to inhibit cancerous cell growth in said human.

- 32. The method of claim 31, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 33. The method of claim 32, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 34. The method of claim 31, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 35. The method of claim 34, wherein said DNA cross-linking anti-neoplastic agent is administered so as to exert an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.
- 36. The method of claim 35, wherein said DNA cross-linking anti-neoplastic agent is administered so as to exert an effect on a human cell division cycle during S phase to inhibit cancerous growth.
- 37. A method of treating cancer by administering to a human paclitaxel and a DNA cross-linking anti-neoplastic agent in such temporal proximity to each other so as to simultaneously achieve levels of said paclitaxel and DNA cross-linking anti-neoplastic agent in said human sufficient to act synergistically to inhibit cancerous cell growth in said human,

wherein said paclitaxel exerts an effect on a human cell division cycle during M phase to inhibit cancerous growth, and

said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during G.sub.1 or S phase to inhibit cancerous growth.

38. The method of claim 37, wherein said DNA cross-linking anti-neoplastic agent exerts an effect on a human cell division cycle during S phase to inhibit cancerous growth.

- 39. The method of claim 37, wherein said DNA cross-linking anti-neoplastic agent is cisplatin.
- 40. The method of claim 39, wherein said DNA cross-linking anti-neoplastic agent is administered so as to exert an effect on a human cell division cycle during S phase to inhibit cancerous growth.

TITLE: Water soluble paclitaxel prodrugs

#### Brief Summary Text (11):

The present invention seeks to overcome these and other drawbacks inherent in the prior art by providing compositions comprising a chemotherapeutic and antiangiogenic drug, such as paclitaxel or docetaxel conjugated to a water soluble polymer such as a polyglutamic acid or a polyaspartic acid, for example, or to a water soluble metal chelator. These compositions are shown herein to be surprisingly effective as anti-tumor agents against exemplary tumor models, and are expected to be at least as effective as paclitaxel or docetaxel against any of the diseases or conditions for which taxanes or taxoids are known to be effective. The compositions of the invention provide water soluble taxoids to overcome the drawbacks associated with the insolubility of the drugs themselves, and also provide the advantages of controlled release so that tumors are shown herein to be eradicated in animal models after a single intravenous administration.

#### Brief Summary Text (21):

The present invention may also be described in certain embodiments as a method of treating cancer in a subject. This method includes obtaining a composition comprising a chemotherapeutic drug such as paclitaxel or docetaxel conjugated to a water soluble polymer or chelator and dispersed in a pharmaceutically acceptable solution and administering the solution to the subject in an amount effective to treat the tumor. Preferred compositions comprise paclitaxel or docetaxel conjugated to a polyglutamic acids or polyaspartic acids and more preferably to poly (1-glutamic acid) or poly 1-aspartic acid). The compositions of the invention are understood to be effective against any type of cancer for which the unconjugated taxoid is shown to be effective and would include, but not be limited to breast cancer, ovarian cancer, malignant melanoma, lung cancer, gastric cancer, colon cancer, head and neck cancer or leukemia.

#### Detailed Description Text (5):

The paclitaxel may be rendered water-soluble in two ways: by conjugating paclitaxel to water-soluble polymers which serve as drug carriers, and by derivatizing the antitumor drug with water soluble chelating agents. The latter approach also provides an opportunity for labeling with radionuclides (e.g., .sup.111 In, .sup.90 Y, .sup.166 Ho, .sup.68 Ga, .sup.99m Tc) for nuclear imaging and/or for radiotherapy studies. The structures of paclitaxel, polyethylene glycol-paclitaxel (PEG-paclitaxel), polyglutamic acid-paclitaxel conjugate (PG-paclitaxel) and diethylenetriaminepentaacetic acid-paclitaxel (DTPA-paclitaxel) are shown in FIG. 1.

### Detailed Description Text (37):

The present example demonstrates the conjugation of <u>paclitaxel</u> to a <u>water-soluble</u> <u>polymer</u>, poly (1-glutamic acid) (PG). The potential of water-soluble polymers used as drug carriers is well established (Kopecek, 1990; Maeda and Matsumura, 1989). In addition to its ability to solubilize otherwise insoluble drugs, the drug-polymer conjugate also acts as a slow-release depot for controlled drug release.

Detailed Description Text (41):

To a solution of PG (75 mg, repeating unit FW 170, 0.44 mmol) in dry DMF (1.5 mL) was added 20 mg paclitaxel (0.023 mmol, molar ratio PG/paclitaxel=19), 15 mg dicyclohexylcarbodiimide (DCC) (0.073 mmol) and a trace amount of dimethylaminopyridine (DMAP). The reaction was allowed to proceed at room temperature for 4 hrs. Thin layer chromatography (TLC, silica) showed complete conversion of paclitaxel (Rf=0.55) to polymer conjugate (Rf=0, mobile phase, CHCl.sub.3 /MeOH=10:1). The reaction mixture was poured into chloroform. The resulting precipitate was collected and dried in a vacuum to yield 65 mg polymer-drug conjugate. By changing the weight ratio of paclitaxel to PG in the starting materials, polymeric conjugates of various paclitaxel concentrations can be synthesized.

TITLE: Controlled local delivery of chemotherapeutic agents for treating solid

tumors

#### Detailed Description Text (56):

Solid paclitaxel, obtained from Napro Biotherapeutics (Boulder, Colo.) or from the National Cancer Institute (Bethesda, Md.), was mixed with poly[bis(p-carboxyphenoxy)propane-sebacic acid] copolymer (PCPP-SA) (20:80) synthesized according to the method of Domb, A. J., and R. Langer (J. Polym. Sci. 25:3373-3386 (1987)), the teachings of which are incorporated herein by reference, to give a mixture containing 0, 20, 30, or 40% paclitaxel by weight. The paclitaxel-polymer mixture was dissolved in methylene chloride (Fluka, Switzerland) to give a 10% solution (w:v). The solvent was evaporated with a nitrogen stream to yield a dry powder. Paclitaxel-polymer discs (10 mg final weight) were prepared by compression molding 11 mg of the paclitaxel-polymer powder with a stainless steel mold (internal diameter, 2.5 mm) under light pressure from a Carver Press at 200 psi. The discs were sterilized under UV light for 45 minutes.

#### Detailed Description Text (59):

The efficiency of the delivery of paclitaxel incorporated into a biodegradable polymer into the surrounding medium was assessed in vitro as follows.

### Detailed Description Text (61):

Protocol. The paclitaxel-loaded polymer discs were placed in a microporous polyethylene specimen capsule (8.times.8 mm internal diameter and height), which was immersed in 7 ml of 0.1M phosphate buffer, pH 7.4. The apparatus was placed in a 37.degree. C. incubator. The releasing medium was replaced at specified times during the 45-day (1000 hour) incubation period, and the recovered solutions were analyzed by scintillation counting and high pressure liquid chromatography (HPLC). HPLC analysis to confirm the release of intact paclitaxel was performed by extracting 2 ml of solution with methylene chloride and evaporating to dryness. The product was then redissolved in methanol and injected onto a C.sub.la HPLC column (Licosphere-100RP-18, 5 mm; E Merck, Darmstadt, Germany) as part of a Merck Hitachi system composed of a L-4200 UV-Vis Detector, L-6200 intelligent pump, and D-2500 Chromato integrator). The mobile phase consisted of methanol:water (70:30) and detection was at 230 nm. Control solutions containing 100 mM paclitaxel in methanol were used to determine the retention time of paclitaxel under these conditions (6.73 to 9.04 minutes). Radioactive analysis to quantify the amount of paclitaxel release was done by mixing 200 .mu.l of the releasing buffer solution with 4 ml of a scintillation mixture composed of toluene and Lumax (Landgraat, The Netherlands) scintillation mixture in a 2:1 volume ratio. This solution was counted on a 1211 Rack .beta.-liquid scintillation counter (LKB-Wallac OY, Finland). Each measurement represents the average of 3 independent countings. At the end of the release period, the amount of drug remaining in the disc was quantified by dissolving the polymer remnant in methylene chloride and counting the solution by the above technique. Release was measured over time from discs containing 20, 30, and 40% paclitaxel by weight.

### Detailed Description Text (63):

These results show that paclitaxel is released biphasically from the polymer, with an initial burst phase followed by a slower constant release phase. It is likely that the burst phase corresponds to the rapid release of paclitaxel particles embedded within the matrix surface, while the prolonged release represents slower release of paclitaxel from the center of the matrix. The loading of the polymer does not seem to correlate directly with the amount of paclitaxel released during the experimental period. Although the 40% loaded polymer contained twice as much paclitaxel as the 20% loaded disc, the 40% loaded disc only released 1.25 times as much paclitaxel as the 20% loaded disc after 800 hours in a saline bath. If polymer degradation were the sole determining factor of paclitaxel release, then one would expect the loading to correlate directly with total drug released. Since the correlation appears weakened, another factor must be at least partially controlling paclitaxel release from the disc. Most likely, the low aqueous solubility of paclitaxel limits its uptake into media, despite breakdown of the matrix. Alternatively, the hydrophobicity of paclitaxel may inhibit hydrolysis of the polyanhydride matrix. While such interactions do not preclude the clinical use of this formulation, they do make the pharmacokinetics of the preparation more complex and the results less predictable when implanted in vivo as compared with topically applied or systemically administered.

### Detailed Description Text (65):

Demonstration of intracerebral paclitaxel delivery from the polymer matrix in vivo.

### Detailed Description Text (66):

The efficiency of the delivery of <u>paclitaxel from the polymer</u> matrix into surrounding brain tissue and the concentration of active paclitaxel within the brain, as measured up to one month after surgical implant, were assessed as follows.

### Detailed Description Text (70):

Preparation of the <u>paclitaxel loaded polymer</u>. Polymer discs containing labeled paclitaxel were prepared as above, except that a small amount of .sup.3 H-labeled paclitaxel (specific activity, 19.3 Ci/mmol; National Cancer Institute) in toluene was added to the initial solution of polymer and paclitaxel in methylene chloride. The polymer-paclitaxel mixture was then dried in a vacuum desiccator and pressed into discs using a table vise calibrated to form a pellet.

### Detailed Description Text (71):

<u>Paclitaxel-polymer</u> implantation. The procedure for polymer implantation in the rat has been described by Tamargo, R. J., et al. (Cancer Res. 53:329-333 (1993)), the teachings of which are incorporated herein by reference. Briefly, the heads of anesthetized rats were shaved and prepared aseptically. The skull was exposed with a midline incision, and a 3-mm burr hole was drilled through the skull 5 mm posterior and 3 mm lateral to the bregma. The dura was incised with a microsurgical knife (Edward Weck and Co., Inc., Research Triangle Park, N.C.), and the polymer disc was inserted into the brain parenchyma. The wound was irrigated and closed with surgical clips (Clay Adams, Parsippany, N.J.).

# <u>Detailed Description Text</u> (73):

To convert dpm/mg tissue to paclitaxel concentration, a second experiment was performed. Four rats were given implants of 40% loaded polymer discs with 0.39 .mu.Ci/mg. One rat each was sacrificed at 3, 9, 17, and 30 days. The brain was removed and frozen as above. A 2-mm coronal section was taken through the site of the polymer implant. The section was minced and extracted with ethanol. The ethanol fraction was divided in two. The first half was dried in a vacuum desiccator and then resuspended in 100 .mu.l of ethanol. Samples of this solution were spotted on silica thin layer chromatography plates (Sigma, St. Louis, Mo.). A solution of nonradioactive paclitaxel in ethanol was also applied to the plates over the ethanol extract. The plate was developed with methylene chloride:methanol (95:5)

and exposed in an iodine chamber. The R.sub.f value for the paclitaxel was determined and each lane cut into 4 sections: A, origin; B, origin to paclitaxel spot; C, paclitaxel spot; and D, paclitaxel spot to solvent front. The chromatography strips were combined with Atomlight.TM. mixture and counted in a liquid scintillation counter. The distribution of labeled paclitaxel across the chromatography plate allowed determination of signal corresponding to intact drug. To determine the efficiency of extraction, the remaining half of the original extract was combined with mixture and counted, and the residual brain tissue was homogenized and counted as above. The paclitaxel concentration in ng/mg brain tissue was calculated by multiplying the percentage of intact paclitaxel by the dpm/mg brain and dividing by the specific activity of paclitaxel present in the polymer disc.

### Detailed Description Text (81):

The amount of toxicity associated with the paclitaxel loaded polymer implant in the brain was determined as follows.

### Detailed Description Text (84):

As shown in Table 4, there was no apparent acute clinical toxicity from the implant. All of the rats recovered from the implant surgery and were indistinguishable from controls in terms of motor activity, response to stimulus, and grooming. Two rats later developed ataxia and, subsequently, hemiplegia contralateral to the implant, weight loss, and death. One rat died spontaneously without a prodrome. All of the other rats remained neurologically intact throughout the experiment. Histological examination of brain tissue sections through the paclitaxel-polymer implant site showed scattered foci of karyorrhectic nuclei interspersed with areas of normal brain. In addition, there were scattered cytologically atypical cells with large, hyperchromatic, sometimes bilobed, nuclei. These atypical cells were more numerous around the implant site, but were seen bilaterally. The changes were present to varying degrees in the brains of all rats receiving the paclitaxel-polymer implant, but were absent in rats receiving the blank PCPP-SA disc, indicating that the cytological changes were a result of the paclitaxel exposure. There was no quantitative or qualitative difference in the visible cytological changes occurring in animals with paclitaxel implants either between groups with different paclitaxel concentration implants or between animals that exhibited gross neurobehavioral toxicity and those that did not. The degree of cytological pathology was, therefore, spread evenly among the different paclitaxelpolymer preparations.

### <u>Detailed Description Text</u> (85):

A minimal amount of clinical and histological toxicity was associated with the paclitaxel-polymer implant in the rat brain. Three of the 12 rats receiving the implant (20% loaded polymer) without tumor died during the 60-day experimental period, while the other rats tolerated the treatment without any apparent clinical symptoms. Two rats receiving paclitaxel (20 and 30% loaded polymers) after tumor implantation also died without visible tumor, but with the atypia found in all the rats receiving the paclitaxel implant. These atypical changes were consistent with similar cytological alterations produced by a wide variety of chemotherapeutic agents. The symptoms of overt toxicity appeared late in the experiment, 30 days or more after implant, indicating that acute toxicity is not a primary concern. Interestingly, all the rats receiving the paclitaxel implant had cytological abnormalities visible on microscopic examination, and there was no correlation between the degree of atypia and the presence or severity of clinical toxicity. From the pharmacokinetic measurements of intracerebral drug distribution following implantation, it is apparent that these devices produced high drug concentrations distributed throughout the rat brain. These concentrations were maintained intracranially, for at least one month after implant. It is not surprising, therefore, that the brain itself was affected after prolonged exposure to such high paclitaxel concentrations. Nevertheless, several rats from the tumor-polymer studies lived 120 days or more after implantation, and two lived for one year.

Lower doses of paclitaxel could be used in patients, either from a proportionately smaller polymer disc or from a disc with a lower percentage loading of paclitaxel. These doses could be better tolerated for chronic therapy clinically. Other agents administered interstitially to the brain have been reported to show toxicity in animal models without measurable toxicity in clinical trials. Appropriate dosages for treatment of patients can be determined using standard and routine methods.

### Detailed Description Text (87):

Demonstration of the efficacy of the <u>paclitaxel loaded polymer</u> implant at extending survival in rats bearing intracranial 9L gliosarcoma.

#### Detailed Description Text (88):

The efficacy of the <u>paclitaxel loaded polymer</u> implant at extending survival in rats bearing intracranial 9L gliosarcoma was measured as follows.

### Detailed Description Text (90):

Protocol for the intracranial efficacy study. Two separate experiments examining the efficacy of the paclitaxel-polymer implant against the intracranial 9L glioma were performed. Based on in vitro clonogenic assays, the 9L glioma appears relatively resistant to paclitaxel compared to human glioma cells. Intracranial tumor implantation in the rat was performed according to the technique described by Tamargo et al. (1993), the teachings of which are incorporated herein. Briefly, a burr hole was drilled in the dura incised as described above. The cortex and white matter were resected with suction until the superior aspect of the brainstem was visualized. The wound was packed with sterile gauze for 10 minutes to control any bleeding. The gauze was then removed, and a 1-mm.sup.3 piece of the 9L gliosarcoma was introduced into the cranial defect and placed on the brainstem. The wound was irrigated and closed with wound clips. Surgery to implant the polymer-chemotherapy device was performed five days later. The rats were randomized to one of the treatment or control groups and weighed. The original incision was reopened aseptically and the placement of the tumor was confirmed. A cruciate incision was made in the surface of the tumor and the polymer disc advanced into the tumor. Treatment rats received 10 mg PCPP-SA discs containing 20, 30, or 40% paclitaxel by weight, while control rats received blank 10 mg PCPP-SA discs containing no paclitaxel. Tamargo et al. have demonstrated that there is no survival difference between rats with intracranial 9L gliomas treated with the blank PCPP-SA discs and rats given a "sham" operation without any implant. Any bleeding was allowed to subside spontaneously, and the wound was irrigated with 0.9% saline and closed with surgical staples. The rats were examined twice daily and the time to death recorded. Long term survivors were sacrificed either 120 days (Experiment 1) or 1 year (Experiment 2) after implant. At death, the brain was removed and fixed in formalin. A coronal section was taken through the polymer implant site and stained with hematoxylin and eosin. The section was examined to confirm the presence or absence of tumor growth. Survival was plotted on a Kaplan-Meier survival curve and statistical significance was determined by a nonparametric Kruskal-Wallis analysis of variance followed by a nonparametric studentized Newman-Keuls test for multiple comparisons, as described by Zar, J. M., Biostatistical Analysis, Prentice-Hall, Inc., Englewood Cliffs, N.J. (1984), the teachings of which are incorporated herein by reference.

#### Detailed Description Text (92):

As shown in Table 5, two separate experiments established that the <u>paclitaxel</u> <u>polymer</u> implant significantly extended survival in rats bearing the intracranial 9L gliosarcoma compared to control animals. Survival was extended from 1.5 to 3.2-fold (P values from <0.05 to <0.001, respectively, nonparametric Newman-Keuls test). Each polymer preparation produced several long term survivors (120 days or longer from tumor implant). The two long term survivors from Experiment 2 were allowed to live for 1 year prior to sacrifice. None of the surviving animals had visible tumor on autopsy either grossly or microscopically in hematoxylin and eosin-stained sections. In contrast, all animals in the control groups died with large

intracranial tumors. There was no significant survival difference among the treatment doses of each experiment (P>0.05, nonparametric Newman-Keuls).

Detailed Description Text (94):

Thus, the <u>paclitaxel-polymer</u> devices extended the median survival of rats bearing intracranial tumors 1.5- to 3.0-fold (P <0.05 to <0.001) compared to controls.

TITLE: Taxoids

### <u>Drawing Description Text</u> (19):

Taxoids of the subject invention may be described by the following formula: ##STR1## wherein R.sub.1 and R.sub.2 are one of OH, R.sub.5, or R.sub.6, with the proviso that at least one of R.sub.1 and R.sub.2 is other than OH and when R.sub.6, there is only one R.sub.6 and the paclitaxel is bonded to a unit of a polymer, which polymer is at least about 5kD.

### Drawing Description Text (32):

Of particular interest are <u>paclitaxel:polymer</u> conjugate taxoids where the <u>paclitaxel moiety is attached to the polymer</u> through a hydrolyzable linkage. For the most part the hydrolyzable linkages will be ester linkages, particularly where these linkages are in proximity to a carboxy group, usually on a .beta. or .gamma. carbon to the ester linkage, so as to provide for a taxoid with drug release half-life from the polymer of between 4 and 24 hours, and preferably between 5 and 7 hours. Specific polymer:paclitaxel conjugates of interest include methyl vinyl ether/maleic anhydride:paclitaxel conjugate, (BP-172), hydroxyethyl acrylate/acrylamide/maleic anhydride:paclitaxel conjugate, vinyl acetate/maleic anhydride:paclitaxel conjugate, vinyl acetate/maleic anhydride:paclitaxel conjugate, vinyl acetate/maleic and the like.

### <u>Detailed Description Text</u> (45):

Methyl vinyl ether/maleic anhydride copolymer (weight average molecular weight=50,000, 30 mg) was dissolved in dry THF (6mL) with heating. After the solution was cooled to room temperature, paclitaxel (60 mg, 0.07 mmol) was added, followed by LiN[Si(CH.sub.3).sub.3].sub.2 (1 M solution in THF, 150 .mu.L, 0.15 mmol) in a single portion. The reaction was allowed to proceed for 1 hour at which point HPLC (size exclusion chromatography) indicated that 70% of the paclitaxel added was bound to the polymer. The solvent was removed on a rotary evaporator and EtOAc (5 mL) was added. The precipitated solid was centrifuged, the supernatant decanted and the process repeated (3 mL EtOAc.times.4). After drying at 65.degree. C. under high vacuum, the solid weighed 72 mg. Size exclusion chromatography showed that the polymer had a purity of 98%, with ca. 1% free paclitaxel present. U.V. analysis for paclitaxel content indicated 56% (w/w) which correlated with the HPLC-derived value. The reaction scheme is provided in FIG. 9.

TITLE: Polymer-bound paclitaxel derivatives

## Brief Summary Text (1):

The present invention is directed to polymer-bound <u>paclitaxel</u> and <u>polymer</u>-bound paclitaxel derivatives endowed with antitumor -activity, to a method for their preparation and to pharmaceutical compositions containing them.

### Brief Summary Text (5):

Preferably, the mol % of units containing the paclitaxel and paclitaxel derivatives is from 0.5 to 2, more preferably, the content of paclitaxel in the polymer was from 2 to 10 % (w/w), most preferred compounds are those characterized by a content of from 4 to 7 % (w/w). The wavy line denotes that the oxygen linked at position 7 of the paclitaxel structure may be in both configurations, i.e. .beta. (natural) or .alpha..

TITLE: Process for preparing nanoparticles

### Brief Summary Text (29):

The formation of nanoparticles may be performed in the presence of a pharmaceutical active principle, which may be introduced either in the solvent of the copolymer or in the precipitation solvent. Suitable pharmaceutical active principles include spiramycin, taxanes, such as Taxotere.RTM. (docetaxel) and taxol. It will be appreciated by one skilled in the pharmaceutical arts that other active principles may be used in accordance with the present invention. The active principle should preferably be soluble in the solvent of the polymer and insoluble in water. Although it is still possible to form nanoparticles if the active principle is soluble in water, the yield thereof may be reduced.
